                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful in developmental blology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyvlitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to therefore treat P. acnes infections. The antibodies can be used as diagnostic agents for determining P. acnes presence, for example, by more linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fire. in the proposition of the printed specification, but was obtained in electronic format directly from WIPO cat fire. in the proposition of the printed specification, but was obtained in electronic format directly from WIPO cat fire. in the proposition of the printed specification, but was obtained in electronic format directly from WIPO cat fire.

                                                                                                                                                                                                                                                                                            capable of detecting 1000 or more genes from Drosophila. The inventue useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid genes from Drosophila and interactions -
                                                                                                                                                                                                                                              The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila.     No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PIR_71:*

1
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                              Score

"The role of copper and P-type ATPase in the acid-tolerance of
Rhizobium leguminosarum by viciae and Sinorhizobium meliloti.",
Submitted (FEB-199) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: INVOLVED IN COPPER TRANSPORT (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: ATP + H(2)0 - ADP + ORTHOPHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Biophys. Acta 1219:223-227(1994).

-- CATALYTIC ACTIVITY: D-fructose 1.6-bisphosphate = 9ly phosphate + D-glyceraldehyde 3-phosphate.

-- PANTWAY: SIXTH STEP IN GLYCOLYSIS.

-- SUBUNIT: HOMOTETRAMER (BY SIMILARITY).

-- SUBUNIT: HOMOTETRAMER (BY SIMILARITY).

-- MISCELLANEOUS: IN VERTEBRATES, THREE FORMS OF THIS UB GLYCOLYTIC ENZYME ARE FOUND, ALDOLASE A IN MUSCLE, AL LIVER, & ALDOLASE C IN BRAIN.

-- SIMILARITY: BELONGS TO CLASS I FRUCTOSE-BISPHOSPHATE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pfam; PF00274; glycolytic_enzy; 1.
